Course 3: UI Automation and Selectors

UI Frameworks

UI Frameworks

UI frameworks define the technology that determines UI elements and their selectors. The user can switch between three UI Frameworks from the UI Explorer designated button:

- **Default:** This is the proprietary method that usually works correctly with all types of user interfaces
- **Active Accessibility:** This represents an earlier solution from Microsoft that makes apps accessible. It is recommended when using legacy software if the default framework does not work as expected
- **UI Automation:** This is the improved accessibility model from Microsoft, which is recommended when using newer applications if the default framework does not work as expected

The selectors generated may be very different from one framework to another.

For more information about UI Framework, refer:
